

What is kahoot and how you play it

Kahoot is a tool that can be used to run large groups of participants. The sessions are quizzes or surveys based on closed questions.

Participants must connect to the game by typing in the game code given to them through the computer that hosts or screens the quiz.

Each participant answers the questions individually on his or her mobile device, after typing in a code and user.

The instructor or operator must register for the system, select a username and password, and screen the quiz. The other participants do not have to register on the site

They connect to the game by typing in the game code they receive from the computer that projects the quiz

The operator must register with the system. Opening a user in the system is easy, safe and fast.

Link: <https://create.kahoot.it/register>

Select the teacher registration option and sign in.

How to play?

To run the quiz you must use a computer or projector to view the activity. Players must choose the correct answer on their device, which is represented by colors and shapes.

After writing the answer or at the end of the time, the score is obtained according to the answers of each of the players.

One of the nice things about the game is that while playing all the players see who is connected and who answered correctly

Have a nice game 😊
